## INTRODUCTION

**A** CHECK LIST of North American Amphibians and Reptiles has long been wished for by all students of American Herpetology. This list has been prepared generally upon the lines of the American Ornithologists' Union Check List of Birds, and following that example, it has included the species and subspecies which the authors deem valid<sup>1</sup> and of certain occurrence in North America, north of the Rio Grande, and in Lower California, Mexico. Miller's List of North American Land Mammals (Bull. U. S. Nat. Mus., No. 79, 1912) has also been a valued guide.

This volume is the result of lists begun some years ago independently by both authors. The arrangement is on the following system: The higher groups and genera are in systematic sequence, the species are in alphabetic order. No attempt is made to give synonyms. Species not listed are believed to be invalid. The citation of original appearance of names is given for all except such (e. g., family names) as are formed automatically. Following the citation of the original description of each species comes the place of first appearance of the name in its present combination — accurate in so far as we have been able to determine. References are added to Cope's North American Batrachia and to his Crocodilians, Lizards, and Snakes of North America. Both are frequently erratic and inaccurate, but large and excellent portions of both works are to a great extent from the pen of S. F. Baird, as painstaking an investigator as this country has produced. These monographs are in

<sup>1</sup> By this statement it is not meant that the authors in all cases have verified the status of a number of more recently established forms by critical study. The judgment of reliable workers has been accepted where no special reason appeared to contraindicate the validity of the form. As for the admission of subspecies — or rather trinominal designation — for certain forms no special attempt has been made at consistency, the authors on principle leaning towards binominals in all cases where the need of trinominals has not been clearly established.

widespread use, and constitute the most recent attempts toward complete lists. In the case of the difficult genus *Thamnophis* references are given to Ruthven's excellent review. Common names for reptiles and amphibians are in great confusion, and are often of generic rather than of specific application. No attempt is made to recognize any except those which are in well-established usage. The host which have been recently coined by various writers are frequently inapt and almost surely unlikely to survive. It is entirely possible that some vernacular names really often used have escaped our notice, since many are in restricted local use. The type localities are as nearly exact as it is possible to determine. This cannot be said regarding the ranges. Many are obviously faulty, but a sincere attempt has been made to collect records of authentic captures; however, with a literature so extensive and so scattered, records have almost surely been overlooked. In many cases, our knowledge does not warrant drawing hard and fast lines delimiting a form's occurrence, and we often state ranges in purposely general terms. There still is opportunity for valuable field work to determine the precise distribution of many of our most common species. An example is the recent discovery that *Virginia valeriae* is far from rare in parts of New Jersey.

Our hearty thanks are due to many for information and advice, especially to Samuel Henshaw, John Van Denburgh, and Alex. G. Ruthven.

G. K. Noble has assisted considerably in verifying references and searching literature, and for this assistance he has our grateful remembrance.

## Introduction to Second Edition.

The first edition of the Check List seems to have been under great change or has come in on knowledge of the North American fauna since it was written, so far indeed that there has been a general request for a revised edition. For we have attempted it as impartial manner as possible. Probably no one will agree with all our conclusions. The reason for revising this revision now is that the present seems to be as good a time as any later date, in view of the fact that the last word will not be said for years to come.

Usage varies so <sup>widely</sup> in regard to the printing of accents on Spanish words that no attempt has been made to satisfy all the bimetic committee in this connection. I shall be glad to receive of our North American co-workers in Herpetology for advice and assistance.

<sup>1</sup> According to Van Denburgh *Dicamptodon ensatus* (Eschscholtz Zool. Atlas, pt. 5, 1833, p. 6, pl. 22), is a synonym of *Ambystoma tenebrosum* Baird and Girard; until, however, it is possible to examine the type, if it still exists at Dorpat or Rostock, it seems better to consider this allocation only provisional, in view of the fact that the figure in the *Zoologisches Atlas* is not very similar to the *Ambystoma*. We do not, however, include it in the list.

Univ. California Publ. Zoöl., Vol. 17, July 11, 1917, p. 132.

*Plethodon oregonensis* COPE

Bull. U. S. Nat. Mus., No. 34, 1889, p. 148, fig. 35.

TYPE LOCALITY: California.

RANGE: Puget Sound to Los Angeles, California.

<sup>1</sup> There is no evidence that Baird ever described this species which is generally credited to him. Cope (Proc. Ac. Nat. Sci. Phila., 1869, p. 100) mentions it as a variety of *Plethodon cinereus*, thus, "Var.  $\gamma$ . *dorsalis*, Baird, M.S. 3776. Louisville, Ky.; Salem, Mass." This reference is a *nomen nudum* pure and simple.

<sup>2</sup> Green described this species and also named the synonymous *erythronotus* upon the same page. It therefore remained for the first reviser to fix the correct name for the species. This Tschudi did in 1838.
